A low-level programming language is a programming language that provides little or no abstraction from a computer's instruction set architecture—commands or functions in the language map closely to processor instructions. Generally, this refers to either machine code or assembly language. Because of the low abstraction between the language and machine language, low-level languages are sometimes described as being "close to the hardware". Programs written in low-level languages tend to be ...

The lowest low level language is Assembly languages that is just next to machine code. The most popular low level programming language is C, as most of operations that are written in C uses less machine code instruction and thus runs very fast. So, if you want to write a program that should run at high speed like Kernel or Operating System.

What is High Level and Low Level Programming Language ...

C is just a step up from assembly language, which is practically a human translation of machine code. It doesn't get any lower than machine code, but people don't read hexadecimal very well, so assembly is considered the lowest level programming language. Most C operations can be translated into less than ten machine instructions.

I classify low-level programming as programming that is very close to the machine, using a lower level programming language like C or assembly. This is in contrast to higher-level programming, typical of user-space applications, using high level languages (e.g. Python, Java).
