of the most commonly
used design patterns is
the factory pattern. In
this pattern, a class
simply creates the object
you want to use.

Consider the following example of the factory pattern:

Design Patterns - PHP: The Right Way

1. Copying all
(including private)
properties manually
(you could also use
get_object_vars(), but
this is shorter): <?php

“Objects, Design,
Agility” — the subtitle
sums the book up quite
well; PHP In Action is
all about object oriented
programming in PHP. I
owe its authors a lot for
having introduced me to
the wonderful world of
OOP. PHP In Action
starts off with an

introduction to classes, objects and inheritance. For the beginner programmer this is vital reading but if you can already tell an interface from an abstract class, you might as well skip ahead to part two.

the form data is sent for processing to a PHP file named "welcome.php".

The form data is sent with the HTTP POST method. To display the submitted data you could simply echo all the variables. The "welcome.php" looks like this:

PHP Form Handling - W3Schools

Acces PDF Php In Action

PHP is designed to interact with HTML and PHP scripts can be included in an HTML page without a problem. In an HTML page, PHP code is enclosed within special PHP tags. When a visitor opens the page, the server processes the PHP code and then sends the output (not the PHP code itself) to the visitor's browser.

Object–action interface,
also abbreviated as OAI,
is an extension to the
graphical user interface,
especially related to
direct manipulation user
interface and it can help

to create better human-computer interfaces and increase the usability of a product. There are basically two similar models regarding OAI. This model focuses on the priority of the object over the actions (i.e. it emphasizes the object being selected first, and then any action performed on it. OAI adheres to this model.
